

## VISOCORE® BORDER CONTROL PLATFORM

### One-stop border control solutions

In order to meet with today's global security demands, it must be possible to reliably verify IDs and documents. Thanks to the VISOCORE® Border Control Platform, the control processes required at borders can now be optimised with eGates and pre-checks and dynamically adapted to changing security situations.

#### Advantages at a glance:

- > High degree of flexibility: The platform makes all customary, automated or manual processes easier. Individual components can be activated or deactivated as needed.
- > Manufacturer independence: Integrated into national verification systems, the VISOCORE® Border Control Platform supports a host of different individual components and terminal devices.
- > Reliable decision support: Thanks to the automatic combination of different control methods, verification results are both clear-cut and comprehensive.
- > Fast identity verification: Travellers benefit from efficient control procedures thanks to automated routine processes.
- > User-friendly navigation: Simply structured interfaces mean a user-friendly border control process.

### APPLICATIONS

Millions of people travel abroad every day. Security requirements at international borders have become much stricter due to globalisation and growing traveller numbers.

That's why more and more countries are relying on electronic ID documents with highly complex technologies and security features. In order to keep pace with these developments, state-of-the-art border control systems must be capable of checking a traveller's identity or the validity of visas in a matter of seconds.

With the VISOCORE® Border Control Platform, Bundesdruckerei offers one-stop solutions for effective and secure border control processes with a host of different national verification scenarios.

### PROPERTIES

The VISOCORE® Border Control Platform

- > supports and controls all processes for checking individuals and documents irrespective of whether data has been captured manually or in (partially) automated processes;
- > automatically combines the results from different verification methods – from modern gate and kiosk systems to standard border control desks;
- > enables border control officers or authorised airline staff to quickly verify IDs and to check visas;
- > is connected to official information systems, such as the Schengen Information System (SIS) or the Visa Information System (VIS) via interfaces that are secured several times over.
